Step 17: Wiring View to Stats REST Controller Endpoints

Overview

In this step, we'll wire the Stats view components created in Step 13 to the Stats REST endpoint created in Step 12. To do this, we will modify the `drawChart()` function in `stats.js` to render live data from the server rather than using the hardcoded data created in Step 13.

Modify `drawChart()`

The modifications to the `drawChart()` function follow the pattern established when we wired live data to the client-side CRUD functionality of the application. These changes remove the hardcoded data created in Step 5 and replace it with live data from the server retrieved through the REST endpoint created in the previous step. Replace the current version of `drawCharts()` (in `stats.js`) with this code:

```
// draw the bar chart
function drawChart() {
    $.get('stats/chart').success(function (data) {
        // first, create the DataTable from the response data string.
        // our response string is generated on the server by converting the Java
        // Google DataTable object into a JSON string using the Google
        JsonRenderer
        // object
        var dataTable = new google.visualization.DataTable(data);
        // set options for the chart - we're setting the main title, the
        verticle and
        // horizontal axis labels and the height/width of the chart
        var options = {
            title: 'Contacts By Company',
            vAxis: {title: 'Company', titleTextStyle: {color: 'red'}},
            hAxis: {title: 'Num Contacts', titleTextStyle: {color: 'red'}},
            'width': 500,
            'height': 400
        };
        // create the chart (a BarChart here) - pass in the HTML element into
        which
        // you want to render the chart - here it is the <div> called 'chartDiv'
        on the
        // jQueryChart.jsp page
        var chart =
            new
            google.visualization.BarChart(document.getElementById('chart div'));
        // finally, draw the chart
        chart.draw(dataTable, options);
    });
}
```

Wrap-up

In this step, we wired the Stats chart to live data from the Stats REST endpoint created in the previous step.
