# Lesson 6: Hello, MVC Notes

### Overview

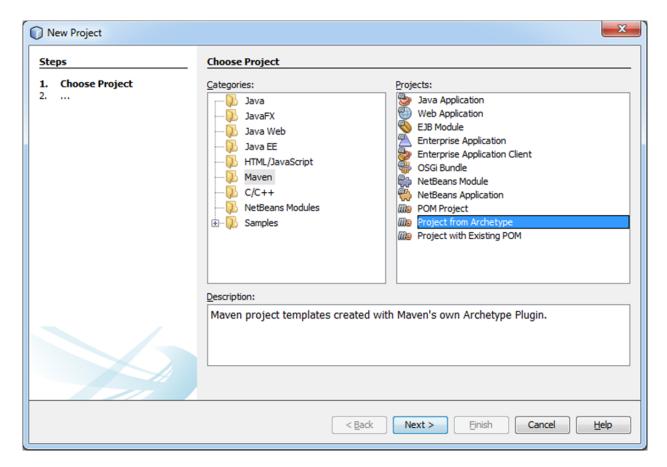

In this lesson, we will create and look at a new Spring MVC web application using the custom SWCGuild Spring MVC Maven archetype. This assumes that you have Java, NetBeans, Maven, Tomcat, and the SWCGuild Spring MVC Maven Archetype properly installed and configured.

This tutorial also assumes that you are familiar with the configuration, structure, and operation of Servlet/JSP-based web applications.

# **Create New Project**

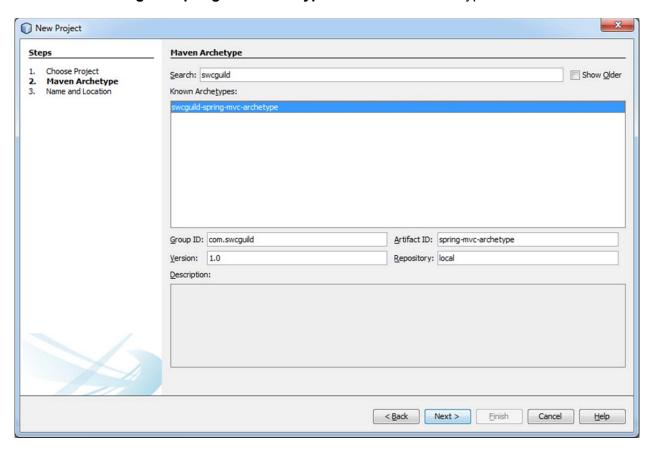

The first step is to create our new Spring MVC project:

- 1. Open NetBeans
- 2. Select **File** → **New Project**
- 3. In the Categories pane, choose Maven
- 4. In the **Projects** pane, choose **Project from Archetype**

- 5. Click Next
- 6. Type in **swcguild** in the Search textbox

## 7. Select swcguild-spring-mvc-archetype under Known Archetypes

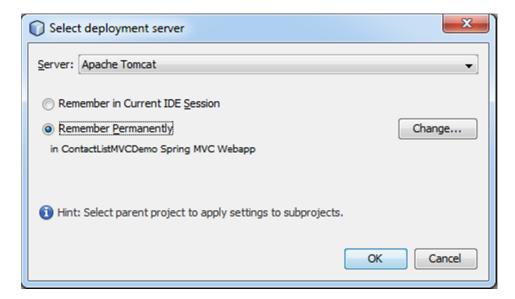

- 8. Click Next
- 9. Type ContactListMVC for the Project Name
- 10. Type in com.swcguild for your Group Id
- 11. Click Finish

# **Test New Project**

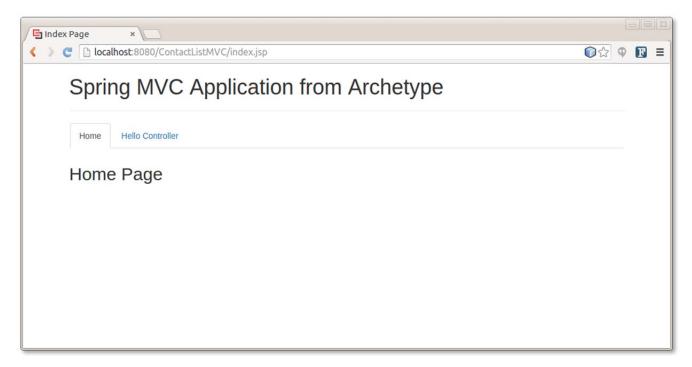

Now we need to test our new project:

- 1. Highlight your new project (**ContactListMVC Spring MVC Webapp**) in the Projects pane
- 2. Select **Run** → **Run Project** (or click the green Run Project arrow, or hit F6)

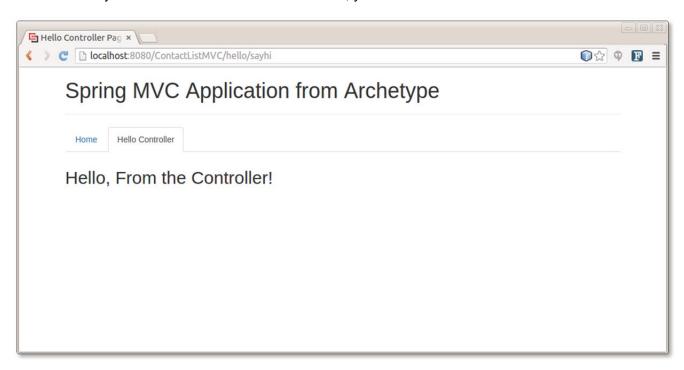

3. You will be prompted to select a deployment server. Select your Tomcat server and click the **Remember Permanently** radio button, then click **OK** 

4. Your project should build, deploy to Tomcat and then display in your browser like this:

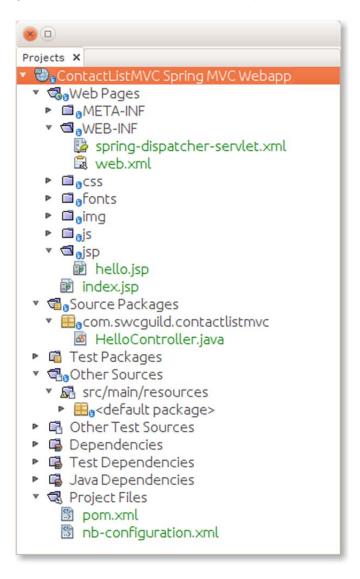

5. When you click on the **Hello Controller** link, you should see this:

The SWC Guild Maven Spring MVC Archetype creates a complete Spring MVC application. Although this application is simple, it contains all the basic building blocks needed for a more substantial application.

The figure below highlights the important files of our initial application:

#### **Notation Conventions:**

The following sections display the contents of the important files in our applications. Each file is listed with an overview and a numbered list containing explanations of specific parts of the file. Each number in the list corresponds to a number comment in the code (all such comments will appear in red font).

### spring-dispatcher-servlet.xml

The spring-dispatcher-servlet.xml contains the configuration for Spring MVC. This file has four important pieces:

- 1. All the XML namespaces for Spring configuration
- 2. Entry that allows us to specify Spring MVC components via annotations
- Entry that specifies where Spring should start looking for annotated Spring MVC components
- 4. The View Resolver configuration.
  - a. In our case, we are using the InternalResourceViewResolver
  - b. We configure it to prefix all view names returned from Controllers with '/jsp/ (this causes Spring MVC to look for view files in the 'jsp' folder)
  - c. We configure it to consider all files ending in '.jsp'

```
<!-- #1: XML namespace declarations start -->
<beans xmlns="http://www.springframework.org/schema/beans"</pre>
       xmlns:context="http://www.springframework.org/schema/context"
      xmlns:mvc="http://www.springframework.org/schema/mvc"
       xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
      xsi:schemaLocation="http://www.springframework.org/schema/beans
 http://www.springframework.org/schema/beans/spring-beans-3.0.xsd
 http://www.springframework.org/schema/context
 http://www.springframework.org/schema/context/spring-context-3.0.xsd
 http://www.springframework.org/schema/mvc
 http://www.springframework.org/schema/mvc/spring-mvc.xsd">
<!-- #1: XML namespace declarations end -->
 <!-- #2 Specify Spring MVC configuration is annotation driven start -->
 <mvc:annotation-driven />
 <!-- #2 Specify Spring MVC configuration is annotation driven end -->
<!-- #3 Specify where Spring should look for MVC components start -->
<context:component-scan base-package="com.swcquild.contactlistmvc" />
<!-- #3 Specify where Spring should look for MVC components end -->
```

#### web.xml

The web.xml is a standard configuration file for Servlet based applications. In our web.xml, we configure four things:

- 1. Our welcome file list
- 2. Servlet Configuration:
  - a. Register the Spring DispatcherServlet
  - b. Create a servlet-mapping entry for it (our servlet will be called for any web request starting with /ContactListMVC/. The Spring DispatcherServlet is the only servlet we register in our application because Spring MVC uses the Front Controller design pattern (see <a href="here">here</a> look at Section 13.2). This means that all requests to our application will first be handled by the DispatcherServlet, which will route the requests to the proper Controller.
  - c. Tell Tomcat to use the **default** servlet when serving up static files such as JavaScript, CSS, and images.
- 3. Location of Spring context file(s). We use the <context-param> entry to tell Spring where to find its configuration files.

4. Context Loader Listener. Tells the servlet container (Tomcat) to load the Spring context when the servlet context is loaded. This means that Spring is automatically loaded when your web application starts up.

```
<?xml version="1.0" encoding="UTF-8"?>
<web-app xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"</pre>
xmlns="http://java.sun.com/xml/ns/javaee"
xmlns:web="http://java.sun.com/xml/ns/javaee/web-app_2_5.xsd"
xsi:schemaLocation="http://java.sun.com/xml/ns/javaee
http://java.sun.com/xml/ns/javaee/web-app_2_5.xsd"
id="WebApp_ID" version="2.5">
  <display-name>Archetype Created Spring MVC Web Application/display-name>
 <!-- #1 Specify welcome files start -->

           classpath:spring-persistence.xml
        </param-value>
   </context-param>
   <!-- #3 Spring context file entries end -->
   <!-- #4 Tell Tomcat to load Spring context when web app is loaded start -
->
   <listener>
       <listener-class>
           \verb|org.springframework.web.context.ContextLoaderListener|\\
       </listener-class>
   </listener>
   <!-- #4 Tell Tomcat to load Spring context when web app is loaded end -->
</web-app>
```

## HelloController.java

This is the one and only Controller component in our simple application. It just sends a message ("Hello from the controller") to the view JSP (hello.jsp).

- @Controller annotation: lets Spring know that this class is a Controller component. Items #2 and #3 in the spring-dispatcher-servlet.xml section above show how we configure Spring to start looking for MVC components in the com.swcguild.contactlistmvc package.
- 2. @RequestMapping annotation: this annotation lets the Spring MVC framework know that methods in this class should be mapped to the web request starting with /ContactListMVC/hello/. Items #2a and #2b in the web.xml section above show how we configure Spring to pay attention to all web requests starting with /ContactListMVC/.
- 3. Another @RequestMapping annotation: this annotation lets the Spring MVC framework know that it should call this particular method (sayHi) when it receives the web request /ContactListMVC/hello/sayhi. Note that this @RequestMapping annotation has an attribute called 'method' this means that this method will only get called for HTTP GET requests to the /ContactListMVC/hello/sayhi URL.
- Here, we are putting an object (in our case, a String) into the model map. The model then gets passed to the view component (hello.jsp) where it can be accessed and/or displayed.
- 5. Return the name of the view we want. Items #4a, #4b, and #4c in the spring-dispatcher-servlet.xml section above show how we configure Spring to find views.

```
package com.swcquild.contactlistmvc;
import java.util.Map;
import org.springframework.stereotype.Controller;
import org.springframework.web.bind.annotation.RequestMapping;
import org.springframework.web.bind.annotation.RequestMethod;
// #1 - Controller annotation
@Controller
// #2 - Request Mapping annotation
@RequestMapping({"/hello"})
public class HelloController {
   public HelloController() {
   // #3 - Request Mapping annotation
   @RequestMapping(value="/sayhi", method=RequestMethod.GET)
   public String sayHi(Map<String, Object> model) {
       // #4 - Objects put in the model are passed to the view
       model.put("message", "Hello from the controller" );
       // #5 - Return the name of the view we want (i.e. hello.jsp)
       return "hello";
```

## hello.jsp

This jsp is the one and only view component for our simple application. Hello.jsp simply takes the message ("Hello from the controller" which is found in the \${message} variable) from the Controller (HelloController.java) and displays it to the screen.

- Directives for this page. The first three 'import' the taglibs for JSTL and Spring so they
  are available for use in the page. These taglibs are not used in this version but the
  imports are included here so hello.jsp can be used as a template for other JSP files.
  The fourth entry is a page directive that specifies the content type (HTML) and the
  encoding (UTF-8).
- Access and display the variable 'message'. We use expression language (EL) notation
  to access this variable. This value was set by the controller (see Item #4 in the
  HelloController.java section above to see how this value was set).

```
<!-- #1 Directives -->
<%@ taglib prefix="c" uri="http://java.sun.com/jsp/jstl/core" %>
<%@ taglib prefix="s" uri="http://www.springframework.org/tags"%>
<%@ taglib prefix="fmt" uri="http://java.sun.com/jsp/jstl/fmt"%>
<%@page contentType="text/html" pageEncoding="UTF-8"%>
<!DOCTYPE html>
<html>
    <head>
        <title>Hello Controller Page</title>
        <!-- Bootstrap core CSS -->
        <link href="${pageContext.request.contextPath}/css/bootstrap.min.css" \</pre>
             rel="stylesheet">
        <!-- Custom styles for this template -->
        <link href="${pageContext.request.contextPath}/css/starter-template.css"</pre>
             rel="stylesheet">
        <!-- SWC Icon -->
        rel="shortcut icon"
href="${pageContext.request.contextPath}/img/icon.png">
    </head>
        <div class="container">
            <h1>Spring MVC Application from Archetype</h1>
            <hr/>hr/>
            <div class="navbar">
                class="nav nav-tabs">
                role="presentation">
                    <a href="${pageContext.request.contextPath}/index.jsp">
                        Home
                    </a>
```

```
role="presentation" class="active">
                    <a href="${pageContext.request.contextPath}/hello/sayhi">
                       Hello Controller
                    </a>
                < /div>
            <h2>Controller</h2>
            <!-- #2 Access the variable called 'message' and display it -->
            <h3>${message}</h3>
        </div>
        <!-- Placed at the end of the document so the pages load faster -->
        <script src="${pageContext.request.contextPath}/js/jquery-</pre>
1.11.0.min.js"></script>
        <script src="${pageContext.request.contextPath}/js/bootstrap.min.js"></script>
</html>
```

#### spring-persistence.xml

This file holds the configuration information for the database and related components. Although it is empty right now, it will contain all MySQL and DAO configuration information as the application is developed. All XML namespace entries required for AOP, transactions, MVC, and DI are included.

```
<?xml version="1.0" encoding="UTF-8"?>
<beans xmlns="http://www.springframework.org/schema/beans"</pre>
      xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
       xmlns:context="http://www.springframework.org/schema/context"
       xmlns:tx="http://www.springframework.org/schema/tx"
              xmlns:aop="http://www.springframework.org/schema/aop"
      xsi:schemaLocation="http://www.springframework.org/schema/beans
 http://www.springframework.org/schema/beans/spring-beans.xsd
 http://www.springframework.org/schema/mvc
 http://www.springframework.org/schema/mvc/spring-mvc.xsd
 http://www.springframework.org/schema/tx
 http://www.springframework.org/schema/tx/spring-tx-3.0.xsd
 http://www.springframework.org/schema/context
 http://www.springframework.org/schema/context/spring-context.xsd
 http://www.springframework.org/schema/aop
http://www.springframework.org/schema/aop/spring-aop-3.2.xsd">
    <!-- Bean definitions go here -->
</beans>
```

#### pom.xml

The Maven POM file for the project contains the project description, dependencies, and compiler setting needed for the project. Most of the dependencies are not needed by the initial "Hello, World" version of the application but will be needed as database, transaction, AOP, and web service support is added.

- 1. Maven project information for our web application.
- 2. Properties indicating which version of JUnit and Spring to use.
- 3. External library dependencies for this project. Most of these are not needed for the initial version but will be used as the project is developed.
- This setting allows Maven to replace tokens in files with real values from profiles, if needed.
- 5. Specifies the version of the Java compiler to use for this project.

```
instance"
 xsi:schemaLocation="http://maven.apache.org/POM/4.0.0 http://maven.apache.org/maven-
v4_0_0.xsd">

                       </plugin>
                </plugins>
          </build>
</project>
```

## Wrap-up

That concludes this lesson. In this step, we did the following:

- 1. Built and installed a custom Maven archetype for Spring MVC projects
- 2. Created a new Spring MVC project using the custom archetype
- 3. Toured all of the major components of our new project and learned how our new project is configured
